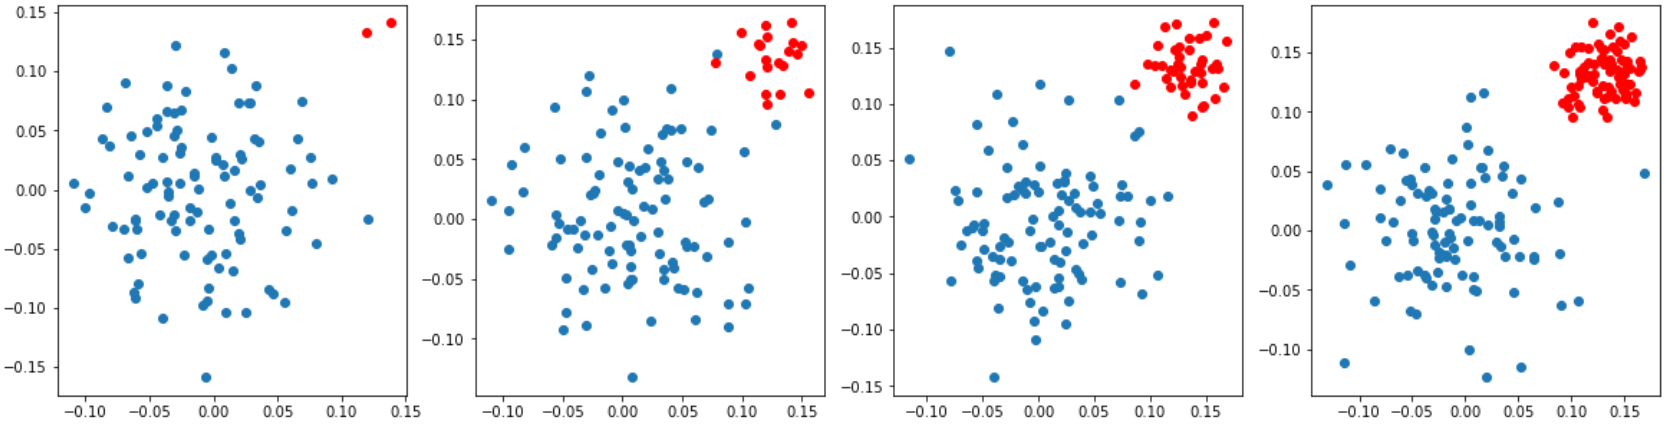
def draw_line(coef,intercept, mi, ma):
    # for the separating hyper plane ax+by+c=0, the weights are [a, b] and the intercept is c
    # to draw the hyper plane we are creating two points
    # 1. ((b*min-c)/a, min) i.e ax+by+c=0 ==> ax = (-by-c) ==> x = (-by-c)/a here in place of y we are keepin
g the minimum value of y
    # 2. ((b*max-c)/a, max) i.e ax+by+c=0 ==> ax = (-by-c) ==> x = (-by-c)/a here in place of y we are keepin
g the maximum value of y
    points=np.array([[((-coef[1]*mi - intercept)/coef[0]), mi],[((-coef[1]*ma - intercept)/coef[0]), ma]])
    plt.plot(points[:,0], points[:,1])
```

What if Data is imabalanced

1. As a part of this task you will observe how linear models work in case of data imbalanced
2. observe how hyper plane is changs according to change in your learning rate.
3. below we have created 4 random datasets which are linearly separable and having class imbalance
4. in the first dataset the ratio between positive and negative is 100 : 2, in the 2nd data its 100:20, in the 3rd data its 100:40 and in 4th one its 100:80

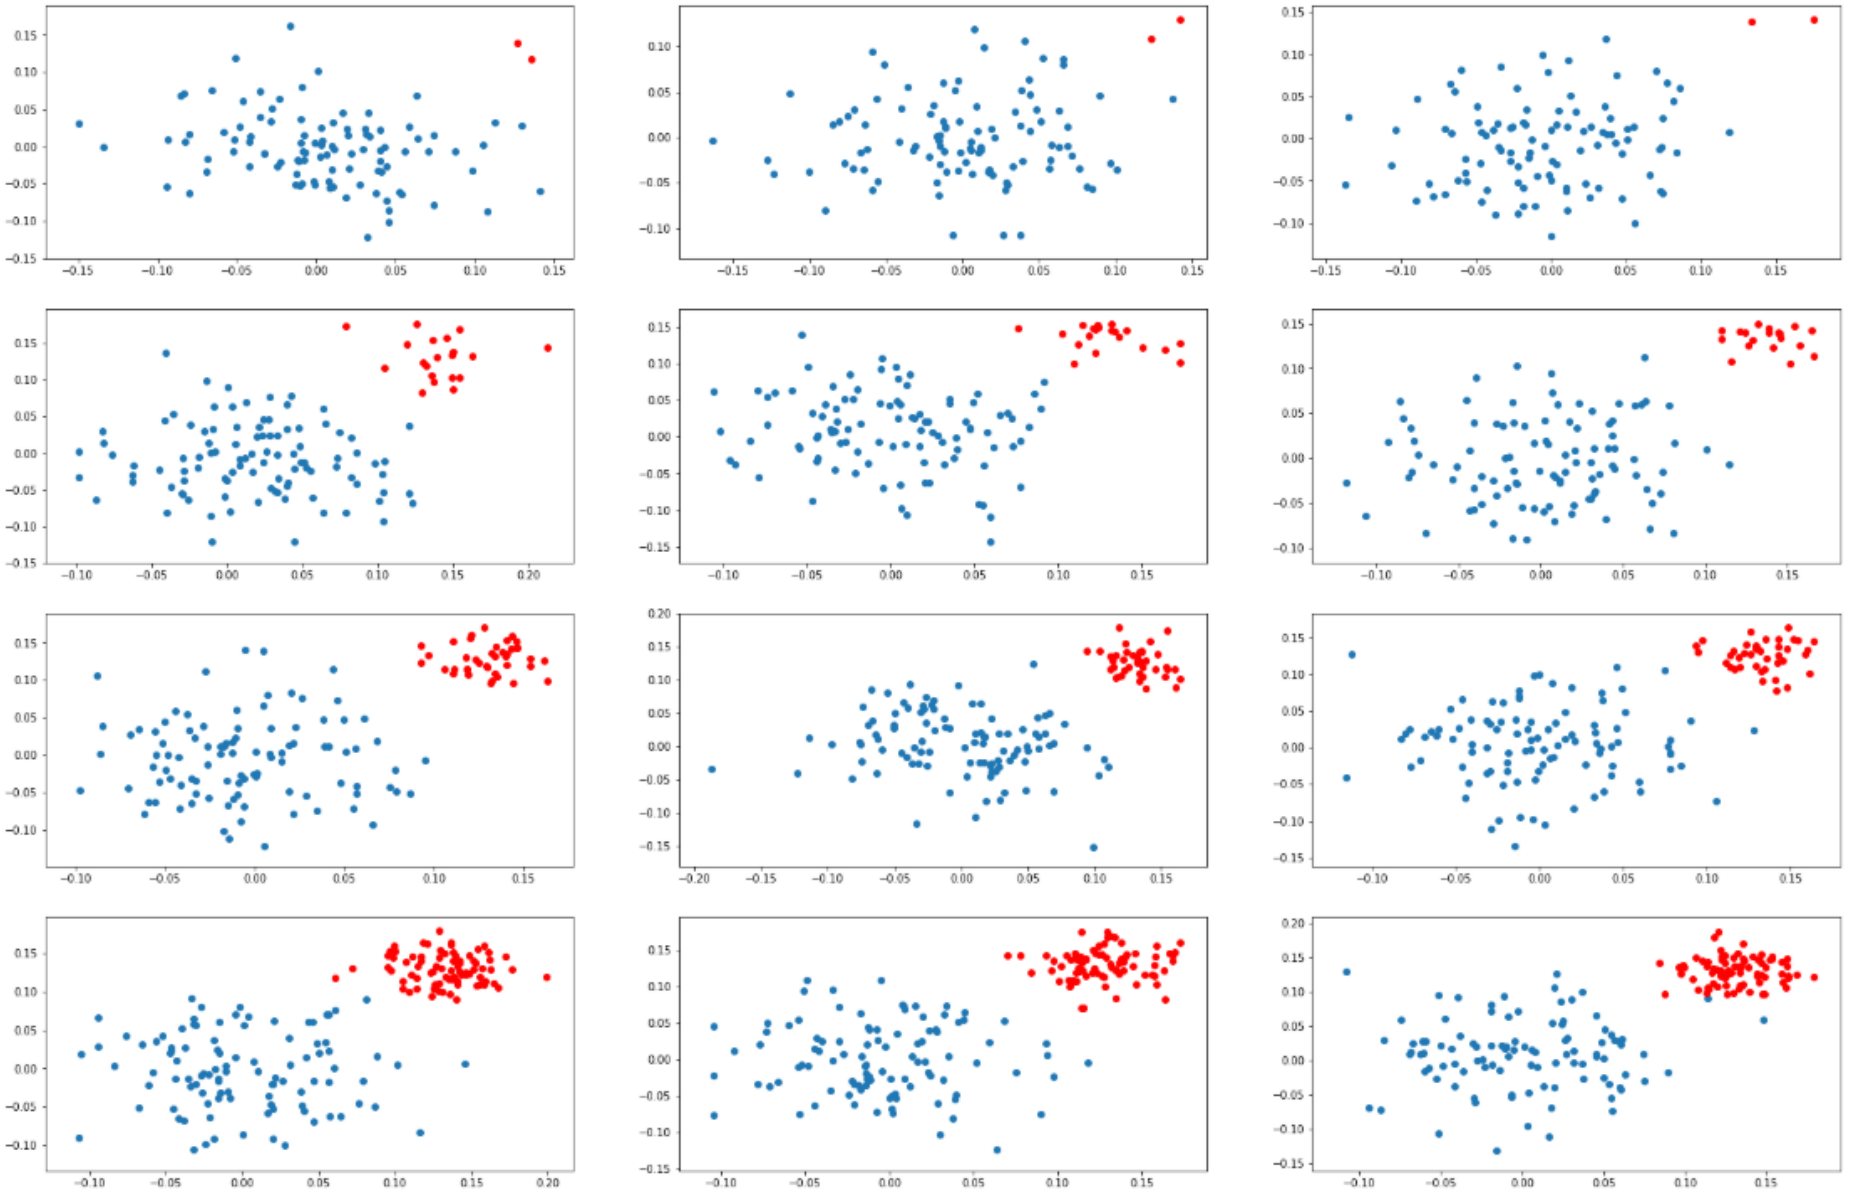
In [13]:
```
# here we are creating 2d imbalanced data points
ratios = [(100,2), (100, 20), (100, 40), (100, 80)]
plt.figure(figsize=(20,5))
for j,i in enumerate(ratios):
    plt.subplot(1, 4, j+1)
    X_p=np.random.normal(0,0.05,size=(i[0],2))
    X_n=np.random.normal(0.13,0.02,size=(i[1],2))
    y_p=np.array([1]*i[0]).reshape(-1,1)
    y_n=np.array([0]*i[1]).reshape(-1,1)
    X=np.vstack((X_p,X_n))
    y=np.vstack((y_p,y_n))
    plt.scatter(X_p[:,0],X_p[:,1])
    plt.scatter(X_n[:,0],X_n[:,1],color='red')
plt.show()
```



your task is to apply SVM (sklearn.svm.SVC (https://scikit-learn.org/stable/modules/generated/sklearn.svm.SVC.html#sklearn.svm.SVC)) and LR (sklearn.linear_model.LogisticRegression (https://scikit-learn.org/stable/modules/generated/sklearn.linear_model.LogisticRegression.html)) with different regularization strength [0.001, 1, 100]

Task 1: Applying SVM

1. you need to create a grid of plots like this



in each of the cell[i][j] you will be drawing the hyper plane that you get after applying SVM (https://scikit-learn.org/stable/modules/generated/sklearn.svm.SVC.html) on ith dataset and
jth learnig rate

i.e

Plane(SVM().fit(D1, C=0.001))	Plane(SVM().fit(D1, C=1))	Plane(SVM().fit(D1, C=100))
Plane(SVM().fit(D2, C=0.001))	Plane(SVM().fit(D2, C=1))	Plane(SVM().fit(D2, C=100))
Plane(SVM().fit(D3, C=0.001))	Plane(SVM().fit(D3, C=1))	Plane(SVM().fit(D3, C=100))
Plane(SVM().fit(D4, C=0.001))	Plane(SVM().fit(D4, C=1))	Plane(SVM().fit(D4, C=100))

if you can do, you can represent the support vectors in different colors,
which will help us understand the position of hyper plane

Write in your own words, the observations from the above plots, and what do you think about the position of the hyper plane

check the optimization problem here https://scikit-learn.org/stable/modules/svm.html#mathematical-formulation

if you can describe your understanding by writing it on a paper
and attach the picture, or record a video upload it in assignment.

In [14]:
```
def draw_line(coef,intercept, mi, ma):

  points=np.array([[((-coef[1]*mi - intercept)/coef[0]), mi],
  [((-coef[1]*ma - intercept)/coef[0]), ma]])

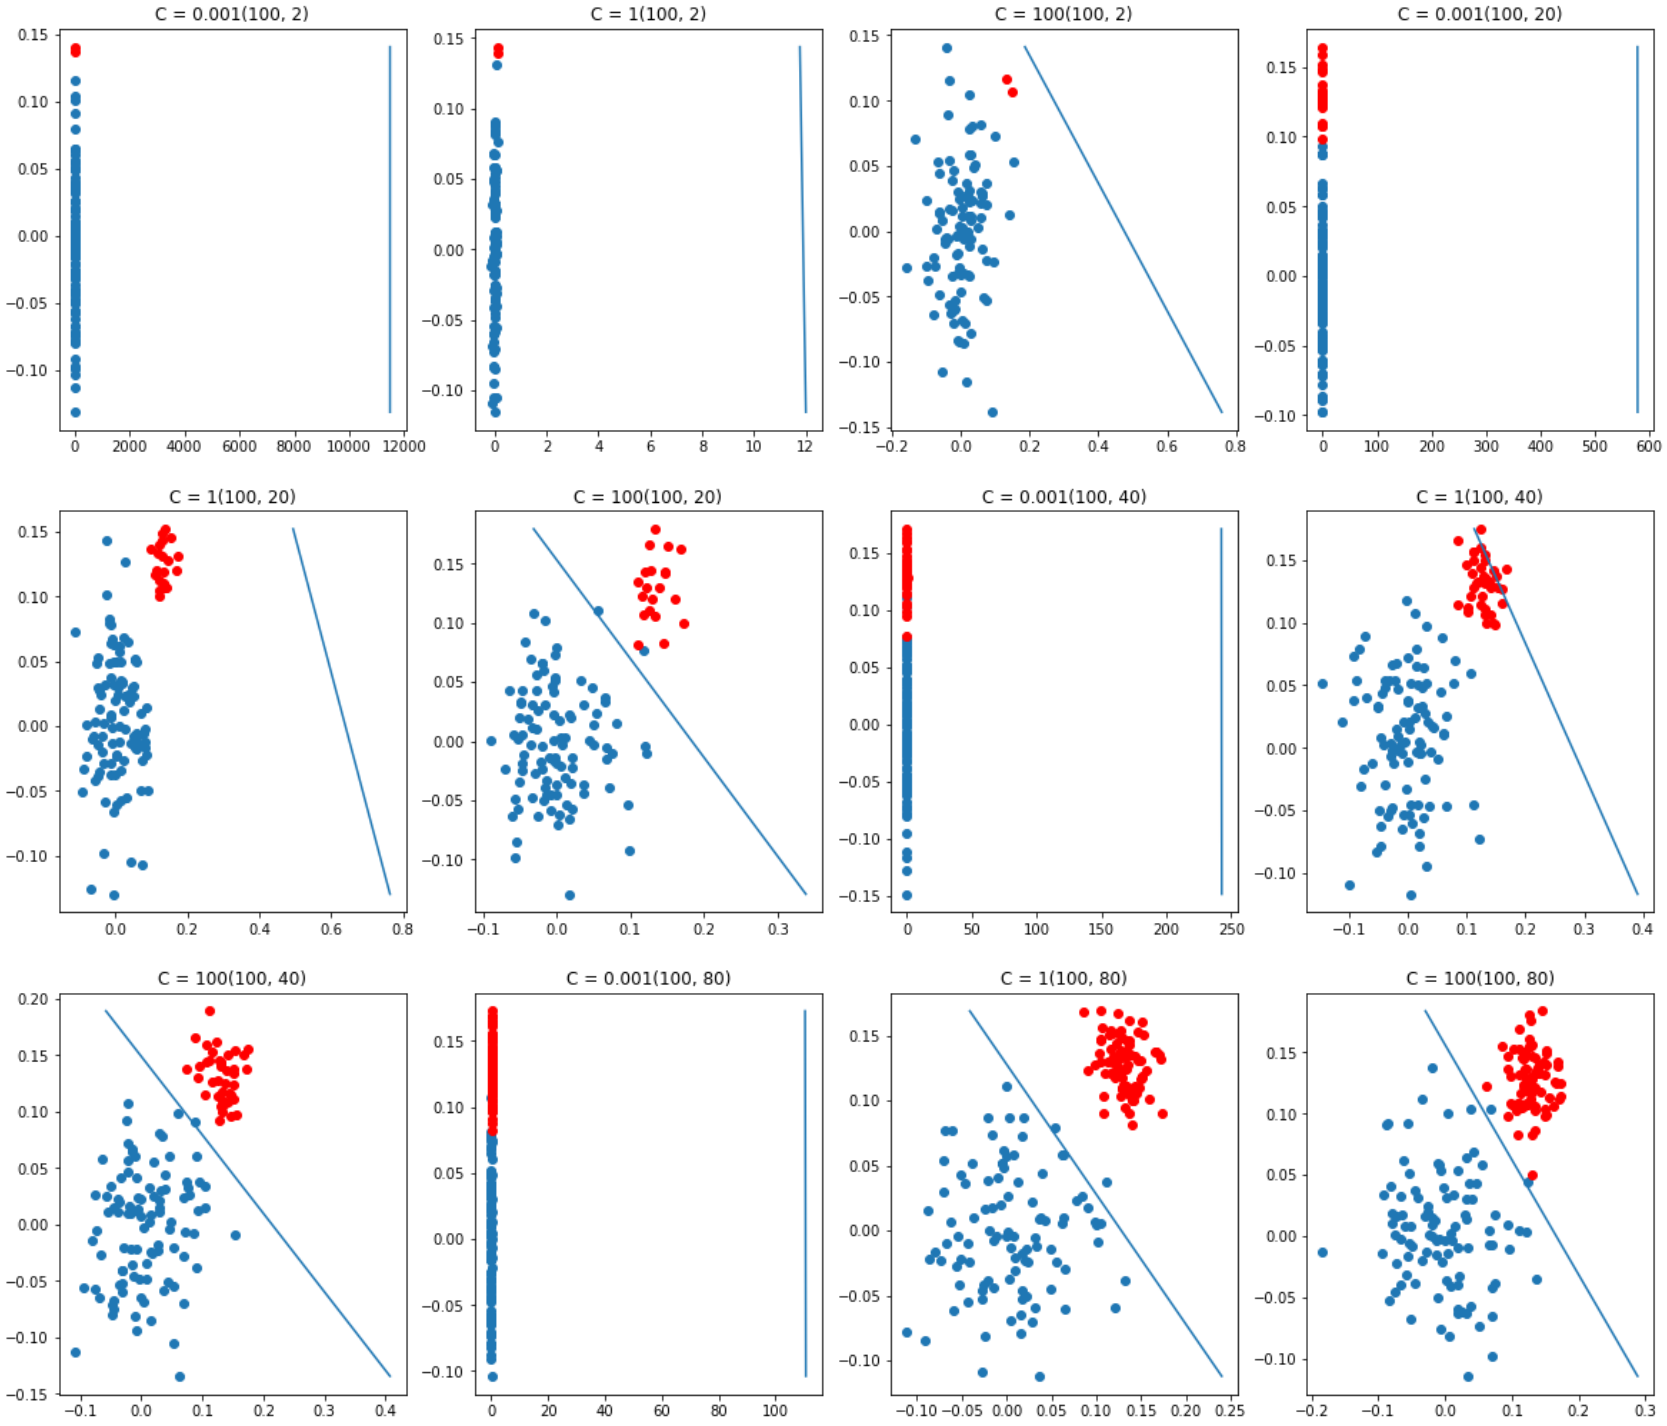
  plt.plot(points[:,0], points[:,1])
```

In [15]:
```
# here we are creating 2d imbalanced data points
from sklearn.svm import LinearSVC

c = [0.001,1,100]
plt.figure(figsize = (20,30))
ratios = [(100,2), (100, 20), (100, 40), (100, 80)]
num=1

for j,i in enumerate(ratios):
    for k in range(0, 3):
        model=SVC(C=c[k], kernel='linear')
        plt.subplot(5, 4, num)
        num +=1
        X_p=np.random.normal(0,0.05,size=(i[0],2))
        X_n=np.random.normal(0.13,0.02,size=(i[1],2))
        y_p=np.array([1]*i[0]).reshape(-1,1)
        y_n=np.array([0]*i[1]).reshape(-1,1)
        X=np.vstack((X_p,X_n))
        y=np.vstack((y_p,y_n))
        model.fit(X, y)
        plt.scatter(X_p[:,0],X_p[:,1])
        plt.scatter(X_n[:,0],X_n[:,1],color='red')
        plt.title('C = '+ str(c[k])+str(i))

        draw_line(coef=model.coef_[0],intercept=model.intercept_,ma=max(X[:,1]), mi= min(X[:,1]))
plt.show()
```



C = 0.001(100, 2)
C = 1(100, 2)
C = 100(100, 2)
C = 0.001(100, 20)
C = 1(100, 20)
C = 100(100, 20)
C = 0.001(100, 40)
C = 1(100, 40)
C = 100(100, 40)
C = 0.001(100, 80)
C = 1(100, 80)
C = 100(100, 80)

If you want to see one with margins and support vectors (although I'm unsure if this is accurate enough):

In [16]:
```
# here we are creating 2d imbalanced data points

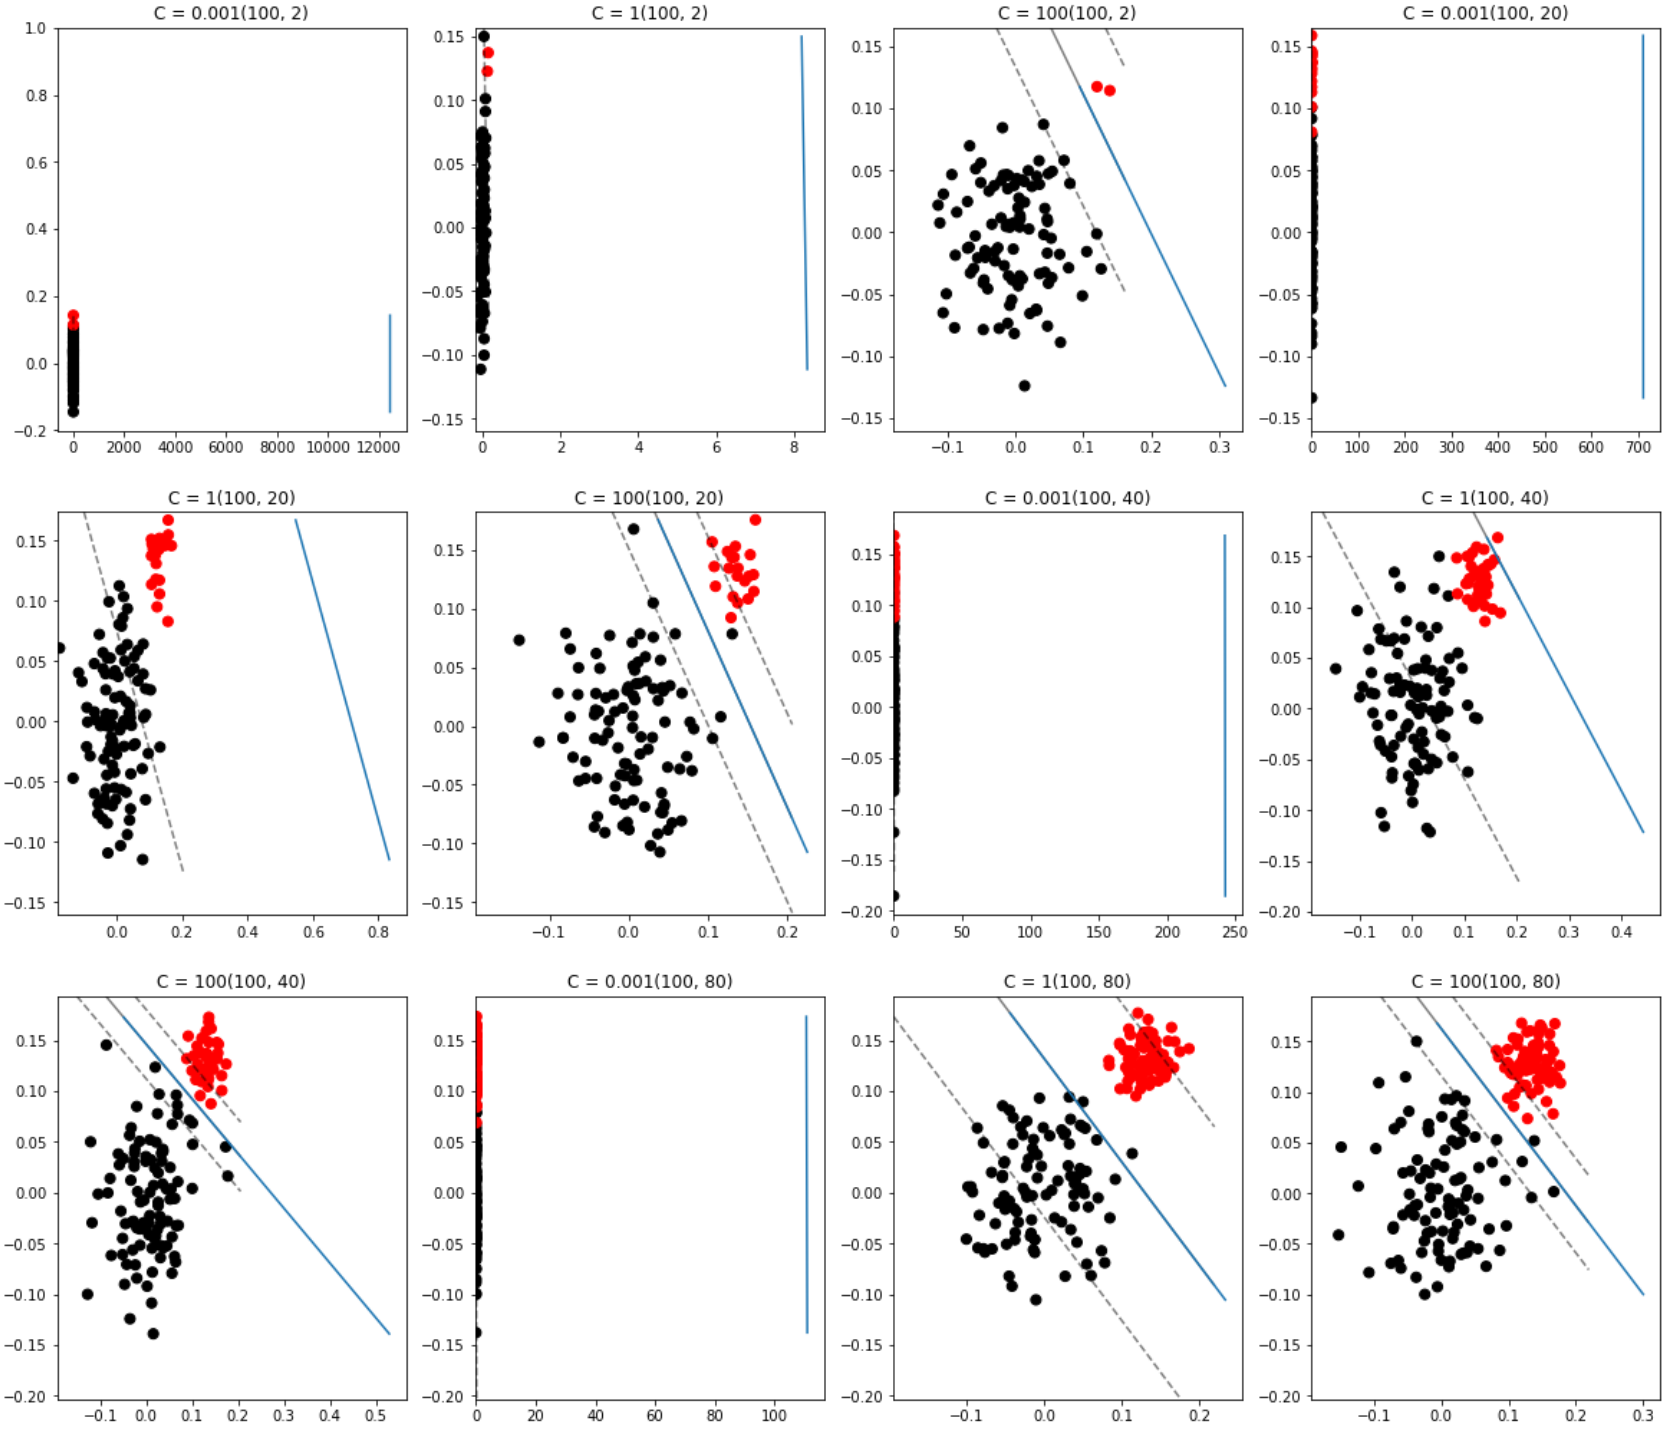
c = [0.001,1,100]
plt.figure(figsize = (20,30))
ratios = [(100,2), (100, 20), (100, 40), (100, 80)]
num=1
ax = plt.gca()
for j,i in enumerate(ratios):
    for k in range(0, 3):
        model=SVC(C=c[k], kernel='linear')
        plt.subplot(5, 4, num)
        num +=1
        X_p=np.random.normal(0,0.05,size=(i[0],2))
        X_n=np.random.normal(0.13,0.02,size=(i[1],2))
        y_p=np.array([1]*i[0]).reshape(-1,1)
        y_n=np.array([0]*i[1]).reshape(-1,1)
        X=np.vstack((X_p,X_n))
        y=np.vstack((y_p,y_n))
        model.fit(X, y)
        plt.scatter(X[:, 0], X[:, 1], c=y, s=50, cmap='flag')

        xlim = ax.get_xlim()
        ylim = ax.get_ylim()
        xx = np.linspace(xlim[0], xlim[1], 30)
        yy = np.linspace(ylim[0], ylim[1], 30)
        YY, XX = np.meshgrid(yy, xx)
        xy = np.vstack([XX.ravel(), YY.ravel()]).T
        P = model.decision_function(xy).reshape(XX.shape)

        plt.contour(XX, YY, P, colors='k',
               levels=[-1, 0, 1], alpha=0.5,
               linestyles=['--', '-', '--'])
        plt.title('C = '+ str(c[k])+str(i))

        ax.scatter(X_p[:,0],X_p[:,1])
        ax.scatter(X_n[:,0],X_n[:,1],color='red')

        draw_line(coef=model.coef_[0],intercept=model.intercept_,ma=max(X[:,1]), mi= min(X[:,1]))
plt.show()
```

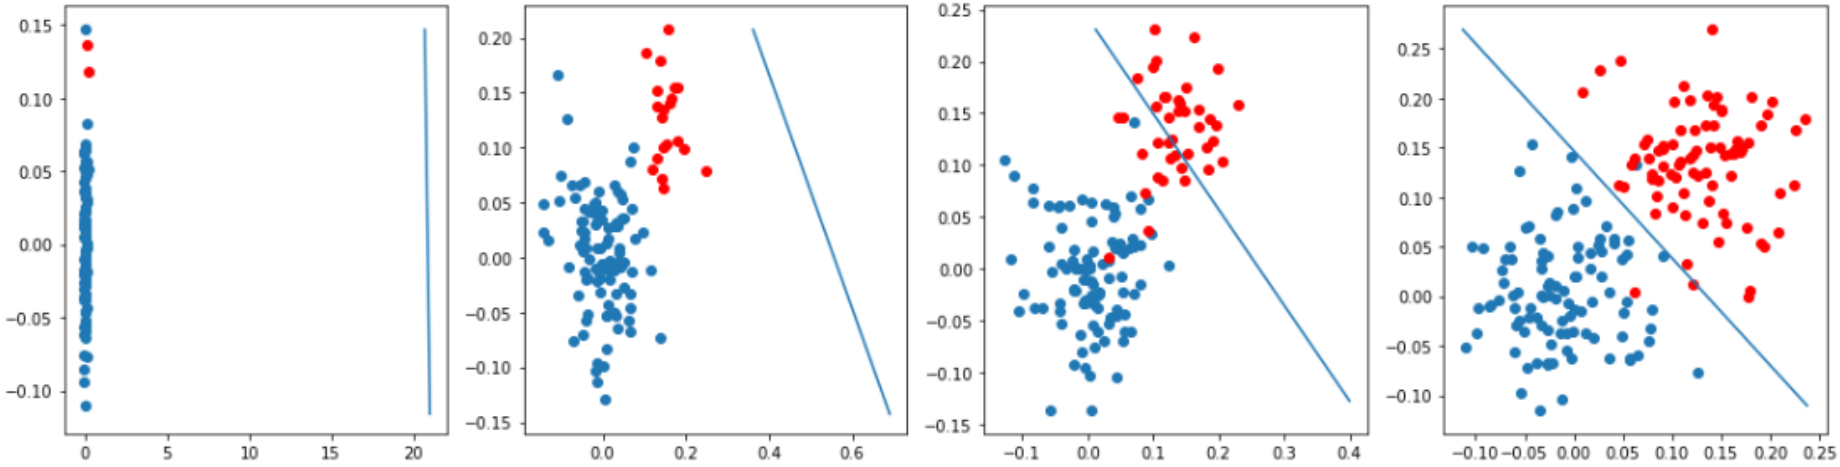


C = 0.001(100, 2)
C = 1(100, 2)
C = 100(100, 2)
C = 0.001(100, 20)
C = 1(100, 20)
C = 100(100, 20)
C = 0.001(100, 40)
C = 1(100, 40)
C = 100(100, 40)
C = 0.001(100, 80)
C = 1(100, 80)
C = 100(100, 80)

Task 2: Applying LR

you will do the same thing what you have done in task 1.1, except instead of SVM you apply [logistic regression (https://scikit-learn.org/stable/modules/generated/sklearn.linear_model.LogisticRegression.html)](https://scikit-learn.org/stable/modules/generated/sklearn.linear_model.LogisticRegression.html)

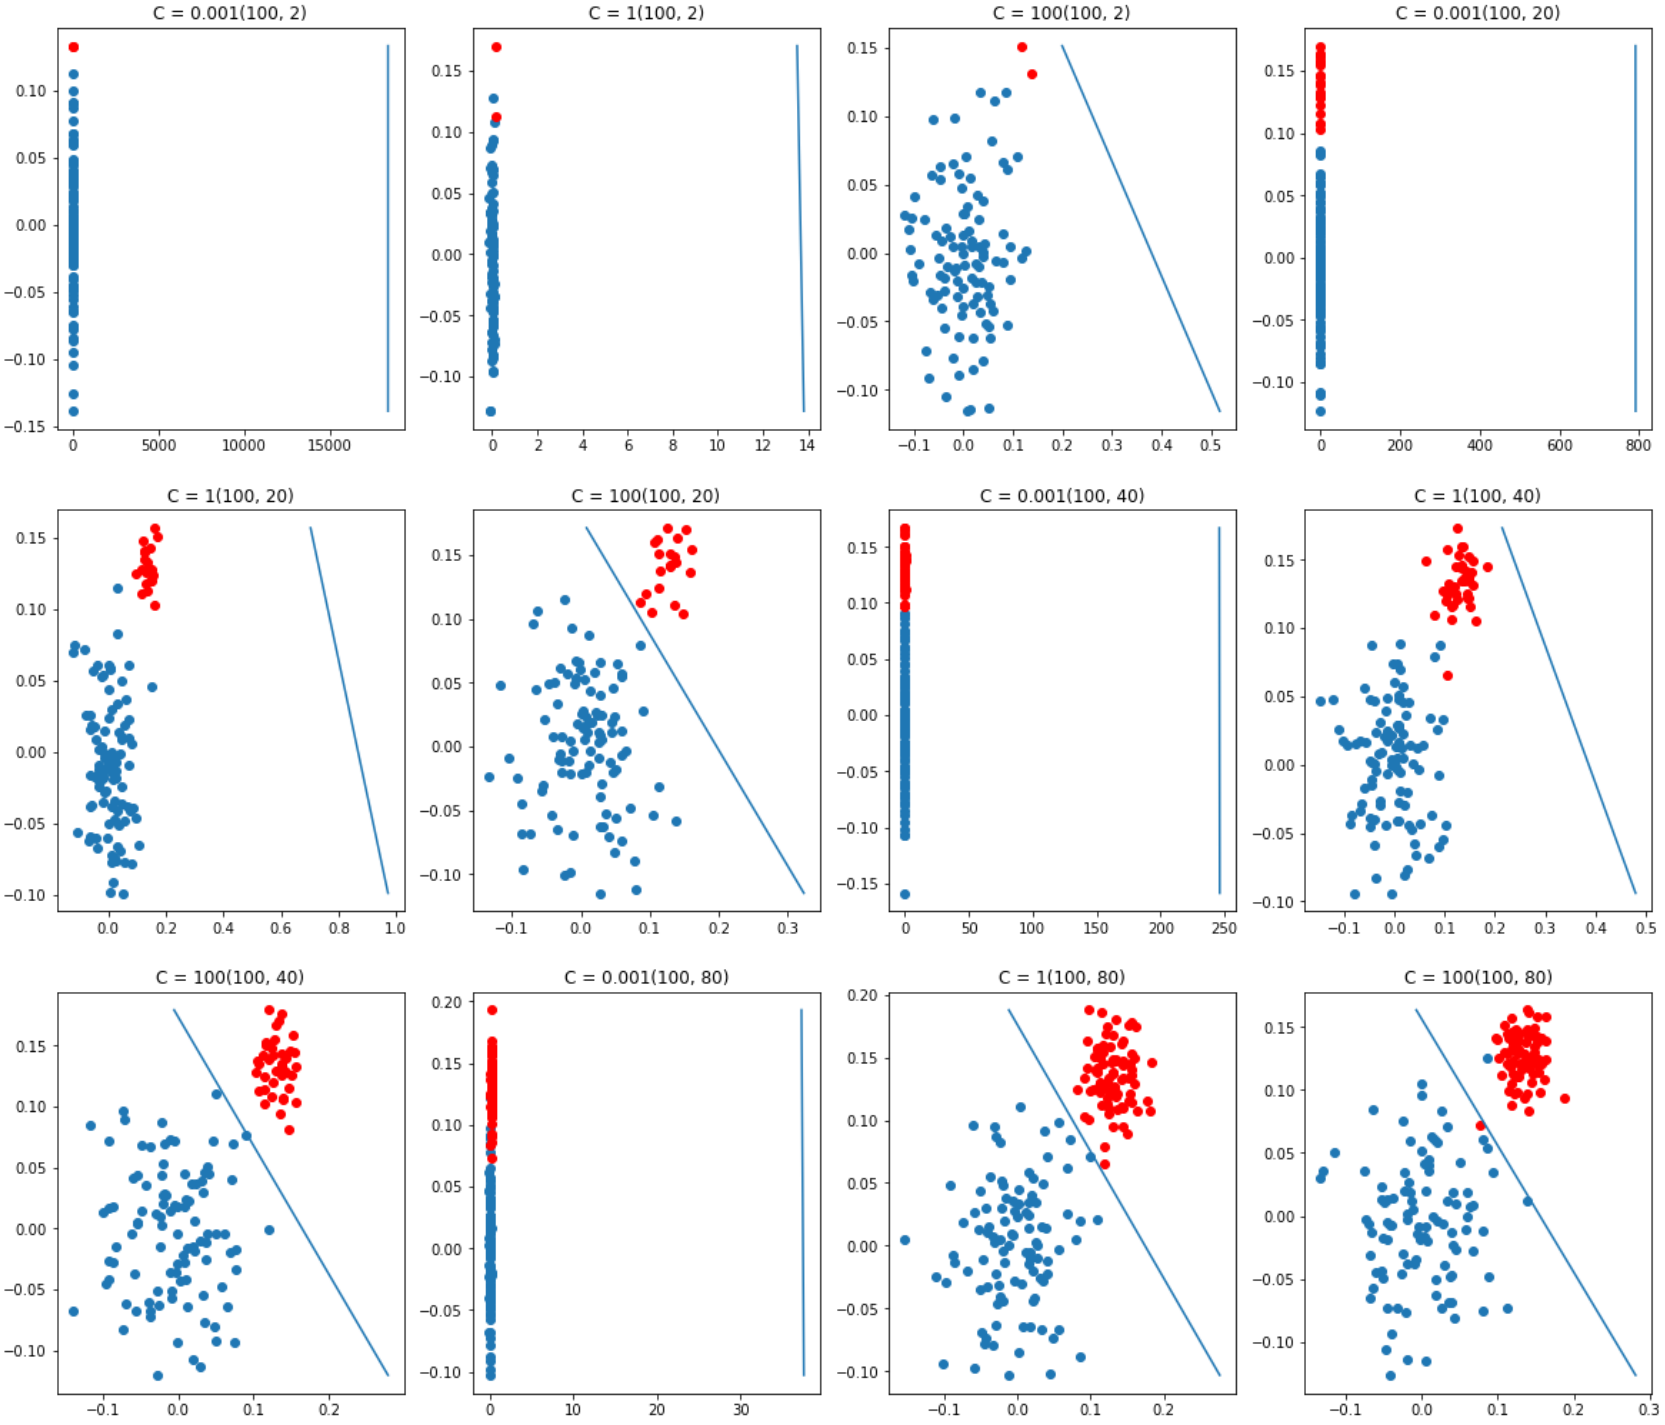
these are results we got when we are experimenting with one of the model



In [17]:
```
from sklearn.linear_model import LogisticRegression

c = [0.001,1,100]
plt.figure(figsize = (20,30))
ratios = [(100,2), (100, 20), (100, 40), (100, 80)]
num=1

for j,i in enumerate(ratios):
    for k in range(0, 3):
        model=LogisticRegression(C=c[k])
        plt.subplot(5, 4, num)
        num +=1
        X_p=np.random.normal(0,0.05,size=(i[0],2))
        X_n=np.random.normal(0.13,0.02,size=(i[1],2))
        y_p=np.array([1]*i[0]).reshape(-1,1)
        y_n=np.array([0]*i[1]).reshape(-1,1)
        X=np.vstack((X_p,X_n))
        y=np.vstack((y_p,y_n))
        model.fit(X, y)
        plt.scatter(X_p[:,0],X_p[:,1])
        plt.scatter(X_n[:,0],X_n[:,1],color='red')
        plt.title('C = '+ str(c[k])+str(i))
        draw_line(coef=model.coef_[0],intercept=model.intercept_,ma=max(X[:,1]), mi= min(X[:,1]))
plt.show()
```



C = 0.001(100, 2)
C = 1(100, 2)
C = 100(100, 2)
C = 0.001(100, 20)
C = 1(100, 20)
C = 100(100, 20)
C = 0.001(100, 40)
C = 1(100, 40)
C = 100(100, 40)
C = 0.001(100, 80)
C = 1(100, 80)
C = 100(100, 80)
